Michaelmas term 2019

Homework 3: Jeffreys' priors and Maximum entropy priors

Lecturer: Georgios Karagiannis

georgios.karagiannis@durham.ac.uk

Exercise 1. (**)Consider the Bayesian model

$$\begin{cases} x_i | \theta & \stackrel{\text{iid}}{\sim} \text{Pn}(\theta), \ \forall i = 1, ..., n \\ \theta & \sim \Pi(\theta) \end{cases}$$

where $Pn(\theta)$ is the Poisson distribution with expected value θ . Specify a Jeffreys' prior for θ .

Hint: Poisson distribution: $x \sim Pn(\theta)$ has PMF

$$Pn(x|\theta) = \frac{\theta^x \exp(-\theta)}{x!} 1(x \in \mathbb{N})$$

Solution.

It is

$$\operatorname{Pn}(x|\theta) = \exp(-\theta) \frac{\theta^x}{x!} \Longrightarrow$$

$$\log(\operatorname{Pn}(x|\theta)) = -\theta + x \log(\theta) - \log(x!) \Longrightarrow$$

$$\frac{\mathrm{d}}{\mathrm{d}\theta} \log(\operatorname{Pn}(x|\theta)) = -1 + x \frac{1}{\theta} \Longrightarrow$$

$$\frac{\mathrm{d}^2}{\mathrm{d}\theta^2} \log(\operatorname{Pn}(x|\theta)) = -x \frac{1}{\theta^2} \Longrightarrow$$

$$-\underline{\mathrm{E}(\frac{\mathrm{d}^2}{\mathrm{d}\theta^2} \log(\operatorname{Pn}(x|\theta)))}_{=I(\theta)} = \frac{1}{\theta} \Longrightarrow$$

so $\pi(\theta) \propto \sqrt{I(\theta)} \propto \frac{1}{\theta^{1/2}}$.

Exercise 2. $(\star\star)$ Consider the Bayesian model

$$\begin{cases} x_i | \theta & \stackrel{\text{iid}}{\sim} \Pr(\theta), \ \forall i = 1, ..., n \\ \theta & \sim \Pi(\theta) \end{cases}$$

where $Pn(\theta)$ is the Poisson distribution with expected value θ . Specify a Maximum entropy prior under the constrain $E(\theta)=2$ and reference measure such as $\pi_0(\theta)=\frac{1}{\sqrt{\theta}}$. In particular, you also have to state the name of the derived Maximum entropy prior distribution and report the values of its parameters.

Hint-1: Poisson distribution: $x \sim Pn(\theta)$ has PMF

$$Pn(x|\theta) = \frac{\theta^x \exp(-\theta)}{x!} 1(x \in \mathbb{N})$$

Hint-2: Gamma distribution: $x \sim Ga(a, b)$ has PDF

$$Ga(x|a,b) = \frac{b^a}{\Gamma(a)} x^{a-1} \exp(-\beta x) \mathbb{1}(x>0)$$

Solution.

It is $\int_{\mathbb{R}_+} \pi_0(\theta) \mathrm{d}\theta = +\infty.$ The maximum entropy prior is such that

$$\pi(\theta|\lambda) \propto \frac{1}{\sqrt{\theta}} \exp(\lambda\theta) = \theta^{-\frac{1}{2}} \exp(\lambda\theta)$$

where I can recognize $\theta | \lambda \sim \text{Ga}(\frac{1}{2}, -\lambda)$.

The expected value of the Gamma distribution Ga(a, b) is

$$E_{\mathrm{Ga}(a,b)}(x) = \int x \frac{b^a}{\Gamma(a)} x^{a-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1-1} \exp(-\beta x) \mathbf{1}(x > 0) = \frac{a}{b} \int \frac{b^{a+1}}{\Gamma(a+1)} x^{a+1} x^{a+1} x^{a+1} x^{a+1} x^{a+1} x^{a+1} x^{a+1} x$$

Because $2=\mathrm{E}(\theta|\lambda)=-\frac{1}{2\lambda}$, it is $\lambda=-\frac{1}{4}.$ Hence,

$$\theta | \lambda \sim \operatorname{Ga}(\frac{1}{2}, \frac{1}{4})$$

Exercise 3. $(\star\star)$ Let x be an observation. Consider the Bayesian model

$$\begin{cases} x | \theta & \sim \Pr(\theta) \\ \theta & \sim \Pi(\theta) \end{cases}$$

where $Pn(\theta)$ is the Poisson distribution with expected value θ . Consider a prior $\Pi(\theta)$ with density such as $\pi(\theta) \propto \frac{1}{\theta}$. Show that the posterior distribution is not always defined.

Hint-1: It suffices to show that the posterior is not defined in the case that you collect only one observation x = 0.

Hint-2: Poisson distribution: $x \sim Pn(\theta)$ has PMF

$$Pn(x|\theta) = \frac{\theta^x \exp(-\theta)}{x!} 1(x \in \mathbb{N})$$

Solution. The prior with $\pi(\theta) \propto \frac{1}{\theta}$ is improper because

$$\int \pi(\theta) d\theta \propto \int \frac{1}{\theta} d\theta = \infty$$

So I need to check the proneness condition,

$$\underbrace{\int_{\mathbb{R}_+} \Pr(x|\theta) \pi(\theta) d\theta}_{\propto f(x)} \quad \begin{cases} < \infty & \text{posterior distribution is defined} \\ = \infty & \text{posterior distribution is not defined} \end{cases}$$

I will show that the posterior distribution is not defined given that I have collected a single observation x = 0. So I need to show that

$$\underbrace{\int_{\mathbb{R}_{+}} \operatorname{Pn}(x=0|\theta)\pi(\theta) d\theta}_{\propto f(x=0)} = \infty$$

It is

$$\begin{split} f(x) &\propto \int_{\mathbb{R}_+} \text{Pn}(x|\theta) \frac{1}{\theta} \text{d}\theta = \int_0^\infty \exp(-\theta) \frac{\theta^x}{x!} \frac{1}{\theta} \text{d}\theta \\ f(x=0) &\propto \int_{\mathbb{R}_+} \exp(-\theta) \frac{\theta^0}{0!} \frac{1}{\theta} \text{d}\theta = \int_0^\infty \exp(-\theta) \frac{1}{\theta} \text{d}\theta \end{split}$$

We will use a convergence criteria in order to check if $\int_0^\infty \exp(-\theta) \frac{1}{\theta} \mathrm{d}\theta = \infty$.

Consider $h(\theta) = \exp(-\theta)\frac{1}{\theta}$. The function $h(\theta)$ has an improper behavior at 0, as it is not bounded there. Let $g(\theta) = \frac{1}{\theta}$. According to the Limit Comparison Test, it is

$$\lim_{\theta \to 0^+} \frac{h(\theta)}{g(\theta)} = \lim_{\theta \to 0^+} \frac{\frac{1}{\theta} \exp(-\theta)}{\frac{1}{\theta}} = 1 \neq 0$$

and

$$\int_0^\infty g(\theta)\mathrm{d}\theta = \int_0^\infty \frac{1}{\theta}\mathrm{d}\theta = \infty.$$

Therefore, it will be

$$\underbrace{\int_0^\infty h(\theta) \mathrm{d}\theta}_{=f(x=0)} = \infty$$

as well.

The Limit Comparison Theorem for Improper Integrals

• Brand, L. (2006; Chapter 7). Advanced calculus: an introduction to classical analysis.

General: Let integrable functions f(x), and g(x) for $x \ge a$.

Let

$$0 \le f(x) \le g(x)$$
, for $x \ge a$

Then

$$\int_{a}^{\infty} g(x) \mathrm{d}x < \infty \implies \int_{a}^{\infty} f(x) \mathrm{d}x < \infty$$

$$\int_{a}^{\infty} f(x) \mathrm{d}x = \infty \implies \int_{a}^{\infty} g(x) \mathrm{d}x = \infty$$

Type I: Let integrable functions f(x), and g(x) for $x \ge a$, and let g(x) be positive.

Let

$$\lim_{n \to \infty} \frac{f(x)}{g(x)} = c$$

Then

• If
$$c\in(0,\infty)$$
:
$$\int_a^\infty g(x)\mathrm{d}x<\infty\Longleftrightarrow\int_a^\infty f(x)\mathrm{d}x<\infty$$

• If
$$c=0$$
:
$$\int_a^\infty g(x)\mathrm{d}x < \infty \implies \int_a^\infty f(x)\mathrm{d}x < \infty$$

• If
$$c=\infty$$
:
$$\int_a^\infty f(x)\mathrm{d}x = \infty \implies \int_a^\infty g(x)\mathrm{d}x = \infty$$

Type II: Let integrable functions f(x), and g(x) for $a < x \le b$, and let g(x) be positive.

Let

$$\lim_{n \to a^+} \frac{f(x)}{g(x)} = c$$

Then

• If
$$c \in (0,\infty)$$
:
$$\int_a^\infty g(x)\mathrm{d}x < \infty \Longleftrightarrow \int_a^\infty f(x)\mathrm{d}x < \infty$$

• If
$$c=0$$
 :
$$\int_{-\infty}^{\infty}g(x)\mathrm{d}x<\infty\implies\int_{-\infty}^{\infty}f(x)\mathrm{d}x<\infty$$

• If
$$c=\infty$$
:
$$\int_{a}^{\infty} f(x) \mathrm{d}x = \infty \implies \int_{a}^{\infty} g(x) \mathrm{d}x = \infty$$

Note: A useful test function is

$$\int_0^\infty \left(\frac{1}{x}\right)^p \mathrm{d}x \quad \begin{cases} <\infty &, \text{ when } p>1\\ =\infty &, \text{ when } p\leq 1 \end{cases}$$
